

How to fix / Resolve Wordpress Blog /comments/feed/ redirect loop

Author : admin

I have recently figured out that accessing <http://www.pc-freak.net/blog/comments/feed/> would end up in a **Redirect Loop** Iâ€™m using **feedburner** to manage my blog feeds so I assume this redirect loop is probably caused by the use of [feedburner](#)

Since this kind of redirect loop is definitely not professional and has a negative influence on search engine indexing (the SEO), I have played a bit until I finally found a way to resolve the **/comments/feed/** redirect loop.

In order to resolve the redirect loop issue it appeared to be really easy.

To fix the issue **Navigate to:**

Tools -> Redirection

Therein add a Source URL to redirect to a Target URL:

For instance:

Source URL: **<http://www.pc-freak.net/blog/comments/feed/>**

Target URL: <http://www.pc-freak.net/blog/feed/>

Press the **Add Redirection** button to confirm the redirection.

Thatâ€™s all your problems with feeds redirect loop while the **/comments/feed/** url is accessed should be resolved.
