

How to list Files in a directory and generate web URLs with PHP

Author : admin

I needed a short PHP script that *reads all, my .html files in a directory and then generates html a hrefs links pointing to each of the html files stored in the directory.*

Here is the short code I come up:

```
$directory_to_open="my-dir/";  
$max_files=100;  
$i=0;  
if ($handle = opendir("$directory_to_open")) {  
while (false !== ($file = readdir($handle)) && $i
```
