

How to restore accidentally removed Gnome volume control in GNOME in GNU / Linux

Author : admin

Accidentally I've removed the **Gnome Volume Control** while trying to remove an applet nearby from the GNOME main menu panel. Unfortunately in GNOME 2, I couldn't find a way to to return back (restore) Gnome Volume Control to the main panel. After a bit of pondering, I've managed to find a way.

Here is how I managed to restore it back:

1. Navigate to:

System > Preference > Startup Applications

2. Click on Add, then add and type the following:

Name: Volume control

Command: `gnome-volume-control-applet`

Comment: Launch volume control applet

Adding the *gnome-volume-control-applet* will launch it every time a new gnome session (with the same user) is initiated. On next gnome login you will see the icon to appear again in the notification area.

Cheers ;)
