## How to set applications (programs) Autorun on XFCE in Xubuntu Linux

Author: admin

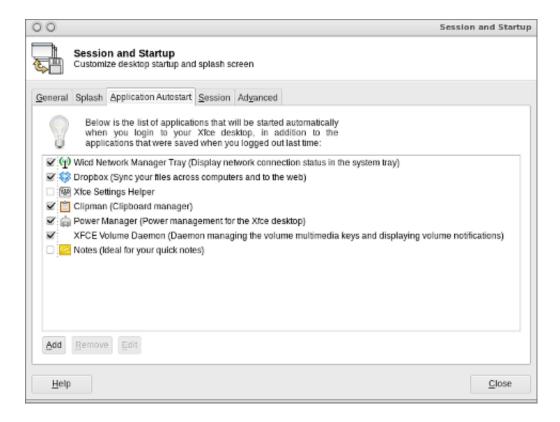

I needed to set **TeamViewer** to autorun, each and every startup on one Xubuntu Linux

**Xubuntu** is running by default with **Xfce 4**. Xfce is a sort of a very liteweight GNOME like graphical environment.

In Gnome the way that is through invoking the **gnome-session-manager**.

In Xfce the command is almost analogous doing changes is done by running:

user@xubuntu:~\$ xfce4-session-manager

Further on simply use the Add button to add applications to load each time user (opens xfce session) / logs in.

Cheers;)
