My PHP/ MySQL Restaurant Reservation Form

Author : admin

Two months ago, I've developed a contact reservation form in PHP. The form is really easily customizable and is straight forward to integrate.
I've developed the form for a small restaurant which was missing the feature on it's joomla based website in order to be able for restaurant clients to reserve tables.

Here is how my restaurant reservation form looks like:

Later on I found there are plenty of possibilities to easily make a reservation form in Joomla but at that time I had no idea that custom contact forms can be prepared with Joomla, so I developed my own one from scratch in plain PHP and MySQL.

The form's fields are in Dutch, because the form I've developed for a Dutch restaurant.
However changing the form text is really easy,to do so open the php file and modify it, according to your needs.
I decided to share here the reservation form in hope that it might be helpful to somebody out there.
The Reservation form is licensed under GPLv2 so you're very welcome to distribute and modify it freely.

The form installation is described in the *README* file you will find bundled with the reservation form archive.

You can d Download my PHP restaurant reservation form here

Feedback on the form is very welcome!
