

Alltray, The Linux, BSD, Unix, handy program to send any application into the system tray

Author : admin

Yesterday I found an interesting small proggy that enables you to tray in a fast manner any unix application

to the GNOME, KDE's system tray.

Alltray also works with many other desktop environments and window managers.

This application made my life a bit easier since now I'm able to send into the tray my mail application of choice (Thunderbird), or as called in Debian icedove. To do that all I had to do was:

\$ alltray icedove . To make this behaviour permanent you can use:

The program **alacarte** which allows you to edit your Gnome menus in a fast and comfortable manner.

For instance on Debian run **alacarte** Go to Internet -> Icedove Mail/News click Properties and change the default command: **icedove %u** change with **alltray icedove %u**

Congrats your Thunderbird will now go to tray any time you run it.

Now you can do the same with any other application that lacks tray support.

Here is a link to [Alltray's website](#)
