

How rescue unbootable Windows PC, Windows files through files Network copy to remote server shared Folder using Hiren's Boot CD

Author : admin

I'm *rescuing some files from one unbootable Windows XP* using a livecd with **Hiren's Boot CD 13**

In order to rescue the three NTFS Windows partitions files, I mounted them after booting a **Mini Linux** from Hiren's Boot CD.

Mounting NTFS using *Hiren's BootCD* went quite smoothly to mount the 3 partitions I used cmds:

```
# mount /dev/sda1 /mnt/sda1
# mount /dev/sda2 /mnt/sda2
# mount /dev/sdb1 /mnt/sdb1
```

After the three NTFS file partitions are mounted I used **smbclient** to list all the available Network Shares on the remote **Network Samba Shares Server** which by the way possessed the NETBIOS name of **SERVER** ;)

```
# smbclient -L //SERVER/  
Enter root's password:  
Domain=[SERVER] OS=[Windows 7 Ultimate 7600] Server=[Windows 7 Ultimate 6.1]
```

```
Sharename Type Comment  
-----  
!!!MUSIC Disk  
ADMIN$ Disk Remote Admin  
C$ Disk Default share  
Canon Inkjet S9000 (Copy 2) Printer Canon Inkjet S9000 (Copy 2)  
D$ Disk Default share  
Domain=[SERVER] OS=[Windows 7 Ultimate 7600] Server=[Windows 7 Ultimate 6.1]  
Server Comment

Workgroup Master  
-----
```

Further on to *mount the //SERVER/D network samba drive* - (the location where I wanted to transfer the files from the above 3 mounted partitions):

```
# mkdir /mnt/D  
# mount //192.168.0.100/D /mnt/D  
#
```

Where the IP **192.168.0.100** is actually the local network IP address of the **//SERVER** win smb machine.

Afterwards I used **mc** to copy all the files I needed to rescue from all the 3 above mentioned win partitions to the mounted **//SERVER/D**
