

How to hide and unhide (show) Administrator User on Windows Vista and Windows 7

Author : admin

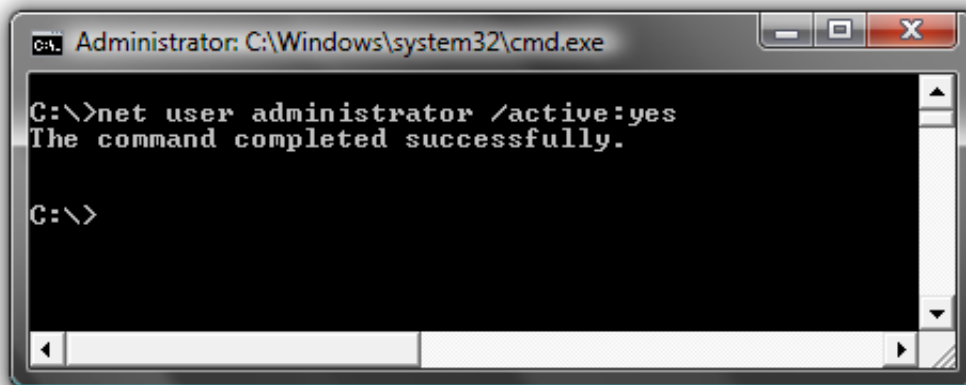

I needed to show the Administrator user on one **Windows 7** install.

Achieving this is done through command prompt - **cmd.exe** where the command prompt with the exclusive option of **Run as Administrator**.

The exact command that **unhides the Administrator user** so further on on next windows login screen one sees Administrator user ready for use is:

```
C:\> net user administrator /active:yes
```

Unhiding Administrator user is always handy whether one needs to do some bunch of operations with Super User. After finishing all my required tasks with administrator I reverted back and **hid the Administrator** user once again like so:

```
C:> net user administrator /active:no
```

This commands also works fine on Vista and presumably on Windows XP.
