Linux Check Laptop battery status from Console / Terminal

Author : admin

I needed to have a quick way to check my battery status via terminal and I googled around looking for a solution. I found the following website explaining in a pretty good way â€œHow to check your battery status in Consoleâ€•.
.Just like the blog explains the proper way to do that in Linux is via the **acpi** command. In case if you donâ€™t have, yet the commandplease install it.
1. The fastest way to check the laptop battery status is via: $ acpiThe output would be something like this:Battery 1: discharging, 91%, 02:00:09 remaining2. Check laptop battery temperature:$ acpi -t3. Check laptop battery AC Power Status$ acpi -a4. Check everything related to acpi$ acpi -V
Another possible way to check for your notebook battery status from console in Linux is via:

acpitool

1. Command to show general information for battery status:$ acpitool2. For detailed battery information use:$ acpitool -B add â€œ-vâ€• for verbose output3. Show information about AC power.$ acpitool -a
Some of the other possible ways to check your battery charge status via console are either via: yabs (Yet Another Battery Status) script or via:
cat /proc/acpi/battery/BAT0/state orcat /proc/acpi/battery/BAT0/info
ENDâ€”â€œ
