

## Test your web browser compatability with Acid3 test

Author : admin

**Acid3 Test** is a group of browser compitability tests. *Acid3* test is a good indicator on how Web ready is your browser.

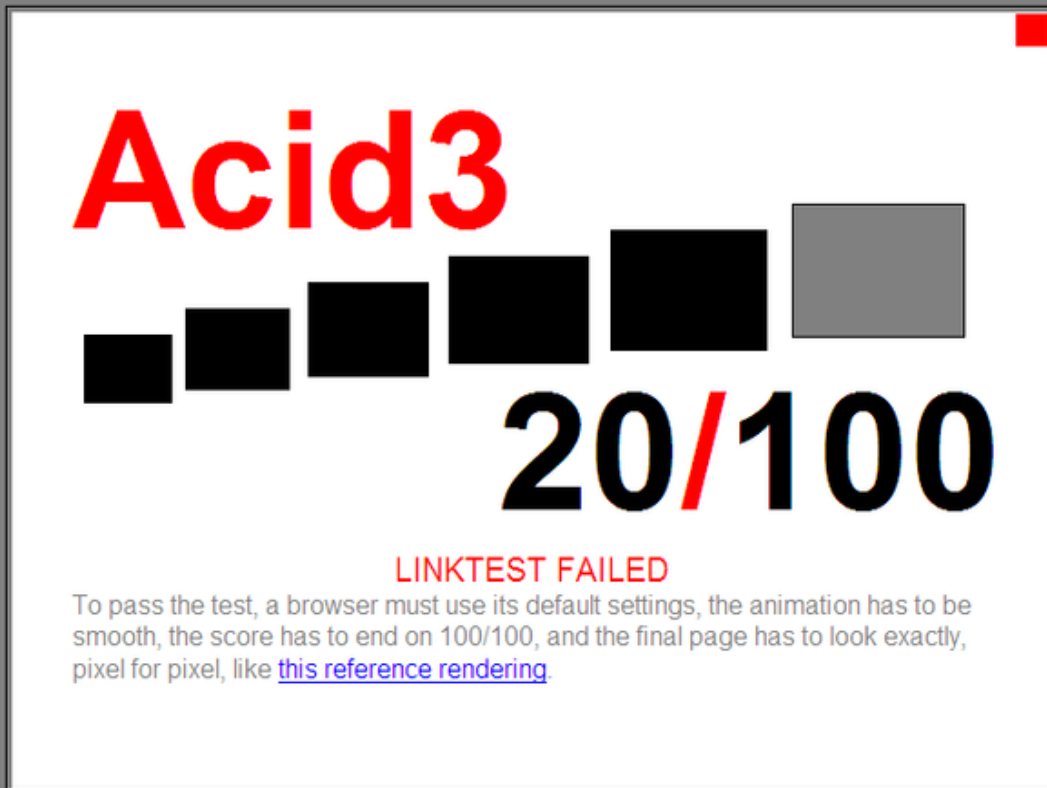

*Acidtest* is part of the web standards project. Latest Firefox 9.0.1 passes the test on 100% (100/100). I've tried it with Epiphany and it scored only 67/100, still I'm using Epiphany on daily basis and I'm quite happy with it.

The tests involved are testing browser for:

- DOM
- DOM2
- Checks on HTML tables and forms browser rendering
- SVG compitability testing
- DOM1 and DOM2 compitability
- Various ECMA Script **Javascript** compitability tests
- Unicode (UTF-16 and UTF-8) browser compitability
- XHML, SMIL, CSS, HTML compitability
- Content-type image/png, text plain etc.

FAIL

The Acid3 test is written itself in Javascript. It consists of 6 testing "stages" (buckets) upon which the browser tested is evaluated.

Each of the test is represented visually by a rectangle. If the a test stage is passed you see a new rectangle appearing in the tested browser.

In *wikipedia*, there is a thorough list with web browsers by type and engine and the level of support for the Acid3 test.

The test is of great use if you're web developer.
