xkill for Windows - Kill hanged programs with one click like in UNIX

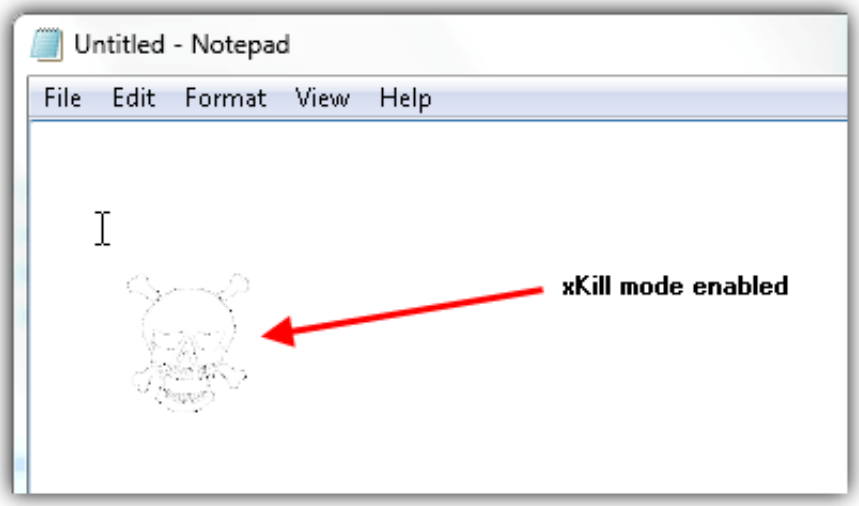
Author : admin

I've used Linux as I've used it over the last 10 years and thus I'm so used to **xkill** that I consider it as a normal tool every modern operating system should have.

Since I'm forced to work on a Windows platform over the last 1 year, every now and then I have **crashing / hanged apps Window** which sometimes is hard to kill using Task Manager or command line tools like **tasklist**, **taskkill** or pstools - Windows Sysinternal tools cause you don't know the exact process name of the Windows crashed application.

Thanksfully a good hearted guy **SuprVillain** made Windows Xkill program. **Windows Xkill** is portable app, so you don't need to install it but simply download and run it.

Win-Xkill runs in system tray and has *"kill mode"* of operation, when Kill mode it is running **Windowns Xkill** operates exactly like UNIX's *xkill*. The mouse pointer turns into **Skull and Cross Bones**, *you point at a Window app you wanted to kill and it gets terminated.*



Win Xkill *kill mode*, can be invoked using also a key press **Control+Alt+Backspace** as well as there is an option to *leave xkill running in the background background, but disabling the tiny skull icon in systray from its interface.*
Enjoy :)
