The caveman used pebbles to count. The Latin word "calculator," meaning pebble, is the root of our word "calculate" used today.

I. True Man emerges from the Stone Age

Recent archaeological discoveries uncovered at the Olorgesailie Gorge location in Tanganyika, Africa in 1936-1960 provide scientific speculations that the oldest type of ape-man inhabited the Earth nearly one million years ago. The important discovery was that this prehistoric of human species actually made crude stone tools and weapons and used these tools effectively.

The student of anthropology is quite familiar with the group of prehistoric specimens known as Pithecanthropus Erectus who lived about 150,000 B.C. After the Ice Age, when glacier masses crevassed toward the North Pole, historians recognize the true predecessor of man in the form of the Neanderthal Man and the even more important Cro-Magnon Man. It is believed that Mr. Cro-Magnon migrated from Asia Minor and Upper Africa into Europe about 100,000 B.C., after the ice mass receded from the land mass.

Thus did Homo Sapiens emerge from the Stone Age. The biologist classifies him as a human being with the powers of thought, reasoning, logic, imagination, emotion, and the ability to communicate with other human beings. These attributes set him above and apart from all other living creatures on this planet.

The Lower Paleolithic Man (12,000 B.C.) was such a person. He had learned the mastery of fire. He was artful, made traps, pitfalls and traps to capture "meat" for his table.

Most historians come right down to "modern times" when tracing man's activities in a community life within a semblance of society. About 7000 B.C., Mr. Neolithic Man is credited with making many important advancements in human progress. This fellow "graduated" from gestural growth to spoken words, and changed another form of communication from use of a crude sign language to some of the first forms of reading.

Mr. Neolithic Man was a pretty clever chap. He moved out of his cave to more modest residence constructed of stone slabs with stone roofing. He used well-made pottery and ovens for cooking utensils. And he made good use of his discoveries in the mechanical arts—he used the wheel, the lever, the wedge, and could control fire to meet his needs.

Mr. Neolithic even figured out a way to count—one, two, three and "many." He probably used these fingers of one hand in a crude sign language in the beginning. After "3," he just gave up the count with "many" in a clenched fist. However, he soon found one to be easily stamped by "many." He overcame the "many" problem with some pebbles, and amazing as it may seem, our word "calculator" was derived from the Latin word "calculator" which meant "pebbles."

Mr. Neolithic would take some pebbles from one pile and place them, one by one, in another pile as he counted. This was good except—when he "cleared the machine"—he had no record of the number of pebbles he had counted. Then came his "great discovery."

He noticed that after heavy rains, his footprints were impressed in the wet, muddy clay. Why not take some clay, mark with special symbols in the clay while it was wet, then let it harden in the next day's sun? Ten pebbles counted, a mark such as "X" impressed in the clay, and poof!—a "deal" was recorded and preserved as an accounting transaction.

Now, when this clever spearmaker manufactured top quality spearheads for the younger, more agile saber-tooth tiger hunter, he created a "record" of the spear-head made and "paid on credit." The pay-off for these "accounts receivable"? Perhaps was excellent tiger or giant bear teeth that he could cleverly work into a necklace for his spouse. Or perhaps the deal involved his choice of the best portion of a fine tiger pelt that his mate had "undered" to be used as a garment. Grade it may have been—he didn't know about money or a medium of exchange. His still honored in his dealings, but the record of a business transaction had been made, and an accounting procedure had been "born."

The evolution of numbers and the alphabet provided man with the "tools" to maintain records of all types of business transactions.

SUAN PAN
(CHINESE ABACUS)

QUIPU

TALLY STICKS

The Suan Pan (Abacus), the knotted rope Quipu, and the wooden Tally Stick were three important counting devices used by man.

Man's attempts to perfect counting devices are evidenced by the Chinese Suan Pan, or Abacus, known to have been in use in the 12th Century. The abacus is known as the *Schoty* in Russia, the *Coufia* in Turkey, the *Chin* in Armenia, and the *Soroban* in Japan.

The Peruvian Quipu consisted of a main rope "woven" with minor ropes attached. Various knots in certain locations designated certain values. "Tie-ups" versions even featured ropes dyed in different colors.

In England before the days of Elizabeth I, English merchants used a notched "Tally Stick" to record debts. The word "tally" was coined, because the notched stick would be split lengthwise down the center and each party took one half. These parties could "tally" the count later by placing the halves together again for accurate comparison—an "audit" procedure that disengaged cheating, and gave the parties physical evidence of the business transactional agreement.

This antique paper roll cash register was developed in the early 1880's.

Multi-totem NCR cash register equipped with optical font for computer input.

Early model Alles-Wales adding machine was acquired by NCR in 1943.

Modern NCR 140 Desk Model Bookkeeping Machine equipped by Punched Tape Recorder.

Early type "Batch" Post Office Machine—items processed in batches after hand-set by classification of items.

NCR 450 Post Distribution Machine with 40 programmed tools, automatic sort, NCR printing, addressing, and analysis.

Four languages setting business and industry around the world — efficiently processed by NCR Units.

The NCR 735 Magnetic Tape Encoder permits source data to be encoded directly onto magnetic tape — for computer input.

Magnetic Ink Character Recognition (MICR) imprinting in four fields is provided by the NCR 481 MICR All-Field Encoder.

The NCR 43 Universal Teller System provides positive control over money and data — permits one-stop banking.

The NCR 420 Optical Reader integrates original entry recordings directly from journal tapes to central EDP processing.

The NCR 460 Data Processor features a simple tape program control principle and expandable internal memory.
