WorkSaver 300 Clustering Capabilities

The NCR WorkSaver 300, in addition to functioning as a standalone workstation, can also be configured in department environments as a master or cluster station. Because it's modular and expandable it allows our current users who have the WS-100 and WS-200 series of systems to add the WS-300 as an additional station or for new users to start their system growth with the WS-300 as a master, standalone or cluster workstation.

The clustering flexibility of the WorkSaver 300 means you can share information and files from a common data base quickly and efficiently, because you're getting the information you need electronically, with no need to go to another office or make a phone call. You can even, using the special WorkSaver Password Security System, get the information you need from a colleague when he or she is ill or out of town. And, of course, clustering means you have the ability to tie into a local area network for even greater efficiency and productivity.

Compatibility in communications and information sharing remains the same in whatever cluster arrangement you may choose, through

NCR's integration of software and seamless interface between applications.

WorkSaver 300 clusters using a WS-300 as the master station can support up to three additional workstations.

When WS-300 Series systems are part of existing WorkSaver clusters, the maximum number of supportable workstations is as follows:

- Master WS-140 supports up to 2 additional workstations
- Master WS-150 supports up to 3 additional workstations
- Master WS-210 supports up to 16 additional workstations

In addition...

Clustering is as easy as connecting a cable from one WorkSaver to another, placing local area networking at your fingertips.
